

Forefront Identity Manager 2010 Advanced Consultant

Introduction

This course follows on from the Implementation (Foundation) course (50382/520), and involves lots of hands-on exercises to cover the more advanced aspects of FIM 2010, and put consultants in a position to be ready to deploy the technology.

It is available as an instructor-led or online course.

Audience and Pre-requisites

This course is intended for Systems Engineers and Architects (and it is also useful for developers) who need to gain a deeper understanding of how FIM 2010 can be implemented. They will have attended the FIM 2010 Implementation Foundation Course (number A520). Students will find it an advantage if they can read simple Visual Basic code, but this is not an absolute pre-requisite. Where code is used, the emphasis will be on the need for code and how it fits into the overall architecture, rather than on the programming details.

At Course Completion

At the end of the course the student will be able to:

- Manage users, groups, policy and credentials through the FIM 2010 portal
- Configure the portal to manage additional resource types, including look and feel, modified forms and navigation
- Handle more complex workflows and MPRs, including temporal MPRs and custom workflows
- Manage both Classic and Portal Rule synchronization, using custom rules extension where necessary
- Build simple custom Management Agents (MAs)
- Understand how to operate and troubleshoot an implementation, including using WMI, backup and disaster recovery considerations
- Understand the technical architecture and different installation topologies of FIM 2010
- Understand a wide range of techniques and architectures, and how to go about implementing more complex architectures

Microsoft Certified Professional Exams

No MCP exam currently exists for this course.

Student Materials

The student kit includes a workbook and other necessary materials for this class.

Course Outline

Module 1: FIM 2010 Reminder

The course starts with a tour of the features of FIM 2010 that were covered in the Foundation Course, pointing out those areas which this course will further develop. This is an opportunity to clear up any misunderstandings before launching into a lot of new information.

Module 2: Portal Configuration

This module covers the interface configuration, including look and feel, and navigation. The portal schema model is also considered: resources, attributes, bindings and validations; use of XPath and search scopes; usage keywords and localization; how to extend the schema.

Module 3: Understanding Synchronization

This module covers metaverse schema extension, and synchronization in depth. It explores the whole process, including holograms and how to troubleshoot synchronization errors. The new Synchronization Rules are mapped to the classic rules, identifying where to use each type, and where extensions are required.

Module 4: More Complex Workflows and MPRs

In this module we examine the FIM Service and application database. This covers more complex workflows using functions and parameters, and temporal (time-based) MPRs for expiration, notification and delayed actions. We create and import some simple Windows Workflow Foundation workflows.

Module 5: Classic Rule Extensions

This module introduces (coded) extensions of classic MA configuration, including coded provisioning, attribute flow and deprovisioning. Topics include DLL extension architecture, metaverse and MA DLL concepts, creating and debugging extensions. Suggestions are made for effective management and best practices.

Module 6: More Management Agents

We then cover File Based MAs, and provide notes about the other types not explicitly covered, before proceeding to look at extensible connectivity MAs (which are explained in terms of practical examples) and finally mentioning password management extensions. The module attempts to satisfy the needs of the more developer-oriented students by providing examples (which are not covered in detail), while focussing on the configuration and outcomes.

Forefront Identity Manager 2010 Advanced Consultant

Module 7: Installation and Alternative Topologies

This module covers installation, but also consideration of likely production topologies, how to scale it, and other considerations (like upgrade and migration of ILM installations).

Module 8: Operation, Troubleshooting and Reporting

This module looks at all the sources of information in FIM 2010, including: ILM 2007 features (MV and CS search, event log, operations tool etc.); troubleshooting via (for example) preview and analyzing requests; and extracting data directly from the synchronization database.

Module 9: Techniques and Architectures

The final module takes what you have learned on this course and applies it, in a very practical way, to a number of scenarios, including techniques such as: approaches to delta import and manual precedence, approaches to additional types of group management, and integrating Certificate Management.

Oxford Computer Group (OCG) is an IT service company that specializes in Identity and Security with a particular focus on Identity and Access Management (IAM) and Information Protection. With 600+ enterprise projects completed and more than 6000 people trained on Microsoft identity and security technologies we have a wealth of expertise, solution components and training courses to offer. Operating from offices in the US, UK, BeNeLux and Germany, OCG is a Microsoft Gold Partner with Identity and Security Solutions, and Learning Solutions competencies. We understand identity and security – benefit from our experience and capability
